Convex sets

- affine and convex sets
- some examples
- operations that preserve convexity
- separating and supporting hyperplanes

Affine set

line through x_1 , x_2 : all points

$$x = \theta x_1 + (1 - \theta) x_2 \qquad (\theta \in \mathbf{R})$$

affine set: contains the line through any two distinct points in the set

example: solution set of linear equations $\{x \mid Ax = b\}$

(conversely, every affine set can be expressed as solution set of system of linear equations)

Convex set

line segment between x_1 and x_2 : all points

$$x = \theta x_1 + (1 - \theta)x_2$$

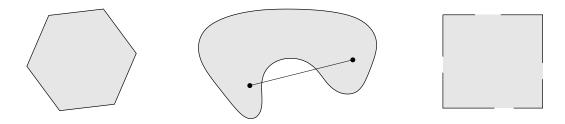

with $0 \le \theta \le 1$

convex set: contains line segment between any two points in the set

$$x_1, x_2 \in C, \quad 0 \le \theta \le 1 \quad \Longrightarrow \quad \theta x_1 + (1 - \theta)x_2 \in C$$

Convex set

examples

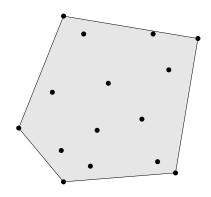

Convex combination and convex hull

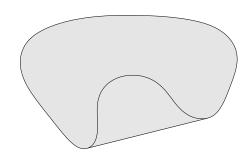

convex combination of x_1, \ldots, x_k : any point x of the form

$$x = \theta_1 x_1 + \theta_2 x_2 + \dots + \theta_k x_k$$

with
$$\theta_1 + \cdots + \theta_k = 1$$
, $\theta_i \ge 0$

convex hull conv S: set of all convex combinations of points in S

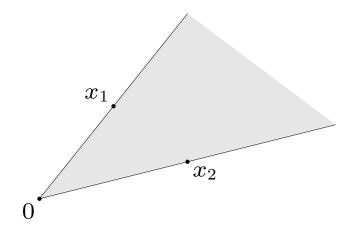

Convex cone

conic (nonnegative) combination of x_1 and x_2 : any point of the form

$$x = \theta_1 x_1 + \theta_2 x_2$$

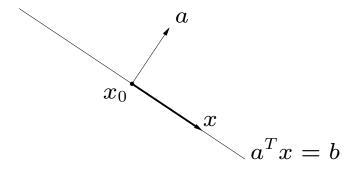

with $\theta_1 \ge 0$, $\theta_2 \ge 0$

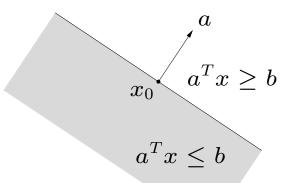

convex cone: set that contains all conic combinations of points in the set

Hyperplanes and halfspaces

hyperplane: set of the form $\{x \mid a^T x = b\}$ $(a \neq 0)$

halfspace: set of the form $\{x \mid a^T x \leq b\}$ $(a \neq 0)$

ullet a is the normal vector

Euclidean balls and ellipsoids

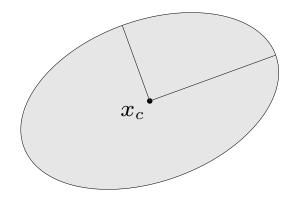

(Euclidean) ball with center x_c and radius r:

$$B(x_c, r) = \{x \mid ||x - x_c||_2 \le r\} = \{x_c + ru \mid ||u||_2 \le 1\}$$

ellipsoid: set of the form

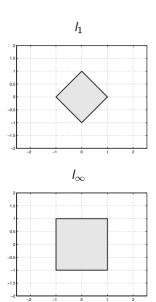

$$\{x \mid (x - x_c)^T P^{-1} (x - x_c) \le 1\}$$

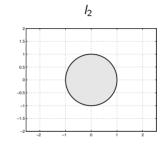

with $P \in \mathbf{S}_{++}^n$ (i.e., P symmetric positive definite)

other representation: $\{x_c + Au \mid ||u||_2 \le 1\}$ with A square and nonsingular

I_1, I_2 and I_∞ balls

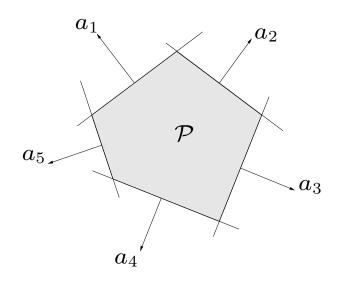

Polyhedra

solution set of finitely many linear inequalities and equalities

$$Ax \leq b, \qquad Cx = d$$

 $(A \in \mathbf{R}^{m \times n}, C \in \mathbf{R}^{p \times n}, \leq \text{is componentwise inequality})$

polyhedron is intersection of finite number of halfspaces and hyperplanes

Operations that preserve convexity

practical methods for establishing convexity of a set C

1. apply definition

$$x_1, x_2 \in C, \quad 0 \le \theta \le 1 \quad \Longrightarrow \quad \theta x_1 + (1 - \theta) x_2 \in C$$

- 2. show that C is obtained from simple convex sets (hyperplanes, halfspaces, norm balls, . . .) by operations that preserve convexity
 - intersection
 - affine functions
 - perspective function
 - linear-fractional functions

Intersection

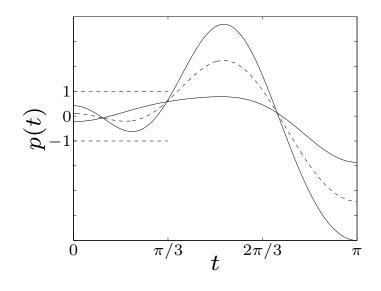

the intersection of (any number of) convex sets is convex

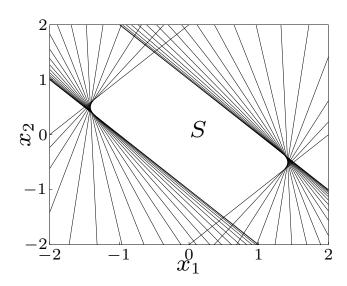

example:

$$S = \{x \in \mathbf{R}^m \mid |p(t)| \le 1 \text{ for } |t| \le \pi/3\}$$

where $p(t) = x_1 \cos t + x_2 \cos 2t + \dots + x_m \cos mt$

for m=2:

Affine function

suppose $f: \mathbf{R}^n \to \mathbf{R}^m$ is affine $(f(x) = Ax + b \text{ with } A \in \mathbf{R}^{m \times n}, b \in \mathbf{R}^m)$

ullet the image of a convex set under f is convex

$$S \subseteq \mathbf{R}^n \text{ convex} \implies f(S) = \{f(x) \mid x \in S\} \text{ convex}$$

ullet the inverse image $f^{-1}(C)$ of a convex set under f is convex

$$C \subseteq \mathbf{R}^m \text{ convex} \implies f^{-1}(C) = \{x \in \mathbf{R}^n \mid f(x) \in C\} \text{ convex}$$

examples

- scaling, translation, projection
- solution set of linear matrix inequality $\{x \mid x_1A_1 + \cdots + x_mA_m \leq B\}$ (with $A_i, B \in \mathbf{S}^p$)
- hyperbolic cone $\{x \mid x^T P x \leq (c^T x)^2, c^T x \geq 0\}$ (with $P \in \mathbf{S}^n_+$)

Perspective and linear-fractional function

perspective function $P: \mathbb{R}^{n+1} \to \mathbb{R}^n$:

$$P(x,t) = x/t,$$
 $\mathbf{dom} P = \{(x,t) \mid t > 0\}$

images and inverse images of convex sets under perspective are convex

linear-fractional function $f: \mathbb{R}^n \to \mathbb{R}^m$:

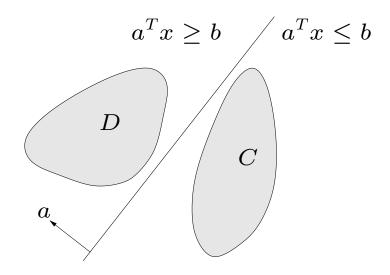

$$f(x) = \frac{Ax + b}{c^T x + d},$$
 $\mathbf{dom} f = \{x \mid c^T x + d > 0\}$

images and inverse images of convex sets under linear-fractional functions are convex

Separating hyperplane theorem

if C and D are nonempty disjoint convex sets, there exist $a \neq 0$, b s.t.

$$a^T x \le b \text{ for } x \in C, \qquad a^T x \ge b \text{ for } x \in D$$

the hyperplane $\{x \mid a^Tx = b\}$ separates C and D

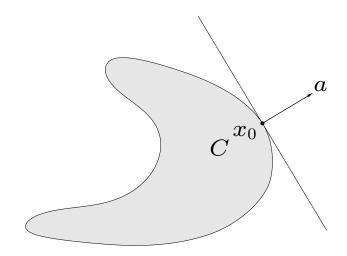

strict separation requires additional assumptions (e.g., C is closed, D is a singleton)

Supporting hyperplane theorem

supporting hyperplane to set C at boundary point x_0 :

$$\{x \mid a^T x = a^T x_0\}$$

where $a \neq 0$ and $a^T x \leq a^T x_0$ for all $x \in C$

supporting hyperplane theorem: if C is convex, then there exists a supporting hyperplane at every boundary point of C
